How do I prevent extraneous rust when working with stainless steel?

Stainless steel does not rust. However, if conventional steel tools are used on stainless steel elements or stainless steel screws the wear debris of these tools can adhere to the surface and begin to rust. This effect, known as extraneous rust, can impair the visual impact and even cause structural damage, resulting in high costs for the necessary repair work. Wear debris that causes extraneous rust can be prevented through the use of stainless steel tools.

Can I strike the screwdriver with a hammer?

Screwdrivers are often misused for light chiselling work. This is dangerous because conventional screwdrivers have not been designed for this type of work. Handles and blades could splinter and cause injuries.

The Wera chiseldriver has been specially developed for these jobs. The end of the handle has a robust metal impact cap, which is directly connected to the pound-thru hexagonal blade and transfers the full force of the hammer blow. The special tough viscous tempered blade prevents splintering and injuries. More torque can be transferred by attaching an open-jawed or ring spanner to the integrated hexagon bolster.

Why is the Kraftform Plus handle made from several components?

Wera makes its Kraftform handles from several materials with different properties. The core is made from a hardwearing plastic that holds the blade securely even when subjected to great forces. The colour-coded soft zones of the external mantle consist of a softer

material with more friction resistance for high torque transfer. The black areas with a harder surface prevent the hand from sticking to the handle enabling you to adjust your grip more quickly.

How can I prevent blisters on my hands?

Manual screwdriving can be quite painful work. Wera has developed the Kraftform handle with a shape that fits snugly in the hand. An optimum positive fit between the hand and the handle and the choice of materials prevent blisters, calluses and excessive strain. You'll notice the difference, especially when repositioning your hand on the handle.

How do I prevent extraneous rust when working with stainless steel?

Stainless steel does not rust. However, if conventional steel tools are used on stainless steel elements or stainless steel screws the wear debris of these tools can adhere to the surface and begin to rust.

This effect, known as extraneous rust, can impair the visual impact and even cause structural damage, resulting in high costs for the necessary repair work.

Wear debris that causes extraneous rust can be prevented through the use of stainless steel tools.

Ballpoint

The ballpoint on the long arm of L-keys for hexagon socket or TORX® screws makes it possible to insert the tool into the screw more quickly and work at an angle even under difficult installation conditions.

Is there no way of stopping L-keys from slipping out of the clip after frequent use?

L-keys should not slip out of the clip accidentally. Wera uses a non-wearing material that ensures that L-keys stay securely fixed even after frequent removal. The handy fold-over clip opens easily with a sliding switch allowing you to remove the L-keys quickly and easily.

Why have there been so few stainless steel tools until now?

Wera recently started using a special process, which ensures that stainless steel tools can meet the same hardness and service life requirements as conventional tools. Vacuum ice hardening gives tools the necessary hardness for industrial applications. The result is a better stainless steel tool for stainless steel materials.

Torque Tools

Why does Wera make adjustable torque screwdrivers?

When it comes to assembly and maintenance work many screws have to be tightened with controlled torque to guarantee the safety of the screw connection and/or prevent damage to the screw or the work piece. Wera's adjustable torque screwdrivers are the perfect tools for these applications. They feature a torque range between 0.3 Nm and 8.8 Nm, two different handles, measurement accuracy of ± 6% and Rapidaptor technology for rapid bit changes.

Rapidaptor

Rapid-in und self-lock

The bit can be pushed into the adaptor without moving the sleeve. The lock is activated automatically as soon as the bit is applied to the screw. Bits are held securely and wobble-free.

Rapid-out

Simply push the sleeve forward to change the bit. The spring mechanism lifts the bit off the magnet and unlocks the tool.

The bit can be easily removed. The rapid-out function makes it easy to remove even the smallest bits without extra tools.

Chuck-all

The Rapidaptor quick-release chucks hold 1/4" DIN 3126-C 6,3 and E 6,3 as well as Wera series 1 and 4 bits.

Single-hand function

Every function of the Rapidaptor quick-release chuck, such as inserting or releasing bits, can be carried out with one hand.

This is faster, more economical and more ergonomic. There are no unnecessary manoeuvres.
