Secvest 2WAY ISDN Module

The ISDN module is an optional add-on module for the Secvest 2WAY. It sends voice texts and control center protocols via ISDN telephone lines. In addition to the integrated analog dialling unit, a Secvest with an ISDN-Modul thus avails of a second, digital telephone output.

The ISDN module is a small, powerful board. It can be quickly and easily plugged into the Secvest 2WAY. In order to send voice messages or (control center) protocols to a control center or a private telephone extension, the ISDN modul only has to be connected to an ISDN connection. In the event of an alarm, the Secvest with an ISDN module can make a call both via PSTN (analog) and via ISDN (digital).

Product highlights:

- Transfers voice texts and protocols
- For properties with ISDN connections
- Easy to install and to upgrade
-
