1. General Description

1.1. Overview

CompactFlash™ Card is one of the most popular flash storage elements in the memory card market. By offering excellent performance and wide compatibility, it also provides a wide range of capacities available for users. In addition, industrial-grade CompactFlash™ cards are available for any applications under rigorous environmental conditions, including extensive temperature, shock and vibration.

1.2. System Features

- Light weight and noiseless
- Implemented with automatic error detection and retry capability
- Support power-down commands and idle modes
- Compatible with PC card and socket services
- Host interface: 8/16 bit access
- Auto-detection of CF/ATA host interface

GOODRAM logo is registered trademark of Wilk Elektronik S.A.
All other trademarks and logos are the property of their respective owners.
All products and specifications are subject to change without notice.

2. Product Specifications

- Support Capacity:
  - SLC: 1-32GB (Diamond & Silver)
  - MLC: 2-64GB (Diamond & Silver)
- Support the following host interfaces:
  - PCMCIA/IDE Interface (Support up to PIO Mode 6/Multi Word DMA Mode4/PCMCIA Ultra DMA Mode 5/Ultra DMA Mode 7)
  - Fully compatible with CompactFlash Specification Version 3.x, 4.x, 5.x and 6.x
  - Fully compatible with PC Card Standard Release 8.0
  - Fully compatible with the IDE standard interface
- Host Transfer Rate:
  - For PC Card/CompactFlash: 25MB/s (PIO6)
  - For IDE standard interface: 166MB/s (UDMA7)
- Built-In NAND Flash Memory Interface
  - Built-in hardware ECC circuit
  - Support SLC and MLC NAND flash memory
  - Support 4KB /8KB data per page NAND flash memory
- 1T RISC uP8051 RAM Mode
  - Internal RAM: 256 Bytes.
  - External RAM: 24KB (On Chip)
- Support SRAM Buffer (Dual Buffer Mode):
  - A Buffer (512 Words)
  - B Buffer (512 Words)
  - CIS Buffer (256 bytes)
- Operating Voltage: 3.0 ~ 5.5V
- Support power-saving implementation
- Environmental Conditions
  - Operation Temp. Range:
    - Silver Series: 0°C to 70°C (SLC & MLC)
    - Diamond Series: -40°C to 85°C (SLC & MLC)
  - Storage Temp. Range: -40°C to 85°C
  - Humidity: RH 95% under 55°C (In operation)
  - Shock*: 1500G/0.5ms
  - Vibration*: 80-2000Hz/20G
  - Acoustic = 0dB

Signal Descriptions

Signal Name	Dir.	Pin	Description
BVD2 (PC Card Memory Mode)	I/O	45	This output line is always driven to a high state in Memory Mode since a battery is not required for this product.
-SPKR (PC CARD I/O Mode)			This output line is always driven to a high state in I/O Mode since this product does not support the audio function.
-DASP (True IDE Mode)			In the True IDE Mode, this input/output is the Disk Active/Slave Present signal in the Master/Slave handshake protocol.
-CD1,-CD2 (PC Card Memory Mode)	O	26, 25	These card detect pins are connected to the ground on the CompactFlash™ Storage Card. They are used by the host to determine if the CompactFlash™ Storage Card is fully inserted into its socket.
-CD1,-CD2 (PC Card I/O Mode)			The signal is the same for all modes.
-CD1,-CD2 (True IDE Mode)			The signal is the same for all modes.
D[15:0] (PC Card Memory Mode)	I/O	31, 30, 29, 28, 27, 49, 48, 47, 6, 5, 4, 3, 2, 23, 22, 21	These lines carry the Data, Commands, and Status information between the host and the controller. D00 is the LSB of the Odd Byte of the World.
D[15:0] (PC Card I/O Mode)			The signal is the same as the PC Card Memory Mode signal.
D[15:0] (True IDE Mode)			In True IDE Mode, all Task File operations occur in byte mode on the lower order bus D00-D07, while all data transfers are 16 bit using D00-D15.
-IOWR (PC Card Memory Mode)	I	35	This signal is not used in this mode.
-IOWR (PC Card I/O Mode)			The I/O Write strobe pulse is used to clock I/O data on the Card Data bus into the CompactFlash™ Storage Card or CF+ Card controller registers when the CompactFlash™ Storage Card or CF+ Card is configured to use the I/O interface. The clocking shall occur on the negative to positive edge of the signal (trailing edge).
-IOWR (True IDE Mode – Except Ultra DMA Protocol Active)			In True IDE Mode, while Ultra DMA mode protocol is not active, this signal has the same function as in PC Card I/O Mode. When Ultra DMA mode protocol is supported, this signal must be negated before entering Ultra DMA mode protocol.
STOP (True IDE Mode – Ultra DMA Protocol Active)			In True IDE Mode, while Ultra DMA mode protocol is active, the assertion of this signal causes the termination of the Ultra DMA burst.
-IORD (PC Card Memory Mode)	I	34	This signal is not used in this mode.

-IORD (PC Card I/O Mode)			This is an I/O Read strobe generated by the host. This signal gates I/O data onto the bus from the CompactFlash™ Storage Card or CF+ Card when the card is configured to use the I/O interface.
-IORD (True IDE Mode – Except Ultra DMA Protocol Active)			In True IDE Mode, while Ultra DMA mode is not active, this signal has the same function as in PC Card I/O Mode.
-HDMARDY (True IDE Mode – In Ultra DMA Protocol DMA Read)			In True IDE Mode when Ultra DMA mode DMA Read is active, this signal is asserted by the host to indicate that the host is ready to receive Ultra DMA data-in burst. The host may negate –HDMARDY to pause an Ultra DMA transfer.
-HSTROBE (True IDE Mode – In Ultra DMA Protocol DMA Write)			In True IDE Mode when Ultra DMA mode DMA Write is active, this signal is the data out strobe generated by the host. Both the rising and falling edge of HSTROBE cause data to be latched by the device. The host may stop generating HSTROBE edges to pause an Ultra DMA data-out burst.
-WE (PC Card Memory Mode)	I	36	This signal is driven by the host and used for strobing memory write data to the registers of the CompactFlash™ Storage Card when the card is configured in the memory interface mode. It is also used for writing the configuration registers.
-WE (PC Card I/O Mode)			In PC Card I/O Mode, this signal is used for writing the configuration registers.
-WE (True IDE Mode)			In True IDE Mode this input signal is not used and should be connected to VCC by the host.
-OE (PC Card Memory Mode)	I	9	This is an Ouput Enable strobe generated by the host interface. It is used to read data from the CompactFlash™ Storage Card in Memory Mode and to read the CIS and configuration registers.
-OE (PC Card I/O Mode)			In PC Card I/O Mode, this signal is used to read the CIS and configuration registers.
-OE (True IDE Mode)			To enable True IDE Mode, this input should be grounded by the host.
RDY/-BSY (PC Card Memory Mode)	O	37	In Memory Mode, this signal is set high when the CompactFlash™ Storage Card is ready to accept a new data transfer operation and is held low when the card is busy. The Host memory card socket must provide a pull-up resistor. At power up and at Reset, the RDY/-BSY is held low (busy) until the CompactFlash™ Storage Card has completed its power up or reset function. No access of any type should be made to the CompactFlash™ Storage Card during this time. The RDY/-BSY signal is held high (disabled from being busy) when the following condition is true: The CompactFlash™ Storage Card has been powered up with +RESET continuously disconnected or asserted.

-IREQ (PC Card I/O Mode)			I/O Operation- After the CompactFlash™ Storage has been configured for I/O operation, this signal is used as –Interrupt Request. This line is strobed low to generate a pulse mode interrupt or held low for a level mode interrupt.
INTRQ (True IDE Mode)			In True IDE Mode, this signal is an active high Interrupt Request to the host.
A[10:0] (PC Card Memory Mode)	I	8, 10, 11, 12, 14, 15, 16, 17, 18, 19, 20	These address lines along with the –REG signal are used to select the following: The I/O port address registers within the CompactFlash™ Storage Card, the memory mapped port address registers within the CompactFlash™ Storage Card, a byte in the card's information structure and its configuration control and status registers.
A[10:0] (PC Card I/O Mode)			The signal is the same as the PC Card Memory Mode signal.
A[2:0] (True IDE Mode)			In True IDE Mode only HA [2:0] are used to select one of the eight registers in the Task File, the remaining address lines should be grounded by the host.
-CE1,-CE2 (PC Card Memory Mode) Card Enable	I	7, 32	These input signals are used to select the card and to indicate to the card whether a byte or a word operation is being performed. –CE2 always accesses the odd byte of the word. –CE1 accesses the even byte or the Odd byte of the word depending on the A0 and –CE2. A multiplexing scheme based on A0, -CE1, -CE2 allows 8 bit hosts to access all data on D0-D7.
-CE1,-CE2 (PC Card I/O Mode) Card Enable			This signal is the same as the PC Card Memory Mode signal.
-CS0,-CS1 (True IDE Mode)			In the True IDE Mode, CS0 is the chip select for the task file registers while CS1 is used to select the Alternate Status Register and the Device Control Register.
-CSEL (PC Card Memory Mode)	I	39	This signal is not used for this mode.
-CSEL (PC Card I/O Mode)			This signal is not used for this mode.
-CSEL (True IDE Mode)			This internal pull-up signal is used to configure this device as a Master or a Slave when configured in the True IDE Mode. When this pin is grounded, this device is configured as a Master. When the pin is open, this device is configured as a Slave.
-REG (PC Card Memory Mode) Attribute Memory Select	I	44	This signal is used during Memory Cycles to distinguish between Common Memory and Register (Attribute) Memory accesses. High for Common Memory, Low for Attribute Memory
-REG (PC Card I/O Mode)			The signal shall also be active (low) during I/O Cycles when the I/O address is on the Bus.

-DMACK (True IDE Mode)			This is a DMA Acknowledge signal that is asserted by the host in response to DMARQ to initiate DMA transfers. While DMA operations are not active, the card shall ignore -DMACK signal, including a floating condition. If DMA operation is not supported by a True IDE Mode only host, this signal should be driven high or connected to VCC by the host. A host that does not support DMA mode and implements both PCMCIA and True-IDE modes of operation need not alter the PCMCIA mode connections while in True-IDE mode as long as this does not prevent proper operation all modes.
WP (PC Card Memory Mode) Write Protect	O	24	Memory Mode- The CompactFlash™ Storage Card does not have a write protect switch. This signal is held low after the addressed port.
-IOIS 16 (PC Card I/O Mode)			I/O Operation- When the CompactFlash™ Storage Card is configured for I/O Operation Pin 24 is used for the –I/O Selected is a 16 Bit Port (-IOIS16) function. A Low signal indicates that a 16 bit or odd byte only operation can be performed at the addressed port.
-IOIS 16 (True IDE Mode)			In True IDE Mode this output signal is asserted low when this device is expecting a word data transfer cycle.
-VS1 **-VS2** (PC Card Memory Mode)	O	33 40	Voltage Sense Signals. –VS1 is grounded so that the CompactFlash™ Storage Card CIS can be read at 3.3 volts and –VS2 is reserved by PCMCIA for a secondary voltage.
-VS1 **-VS2** (PC Card I/O Mode)			This signal is the same for all modes.
-VS1 **-VS2** (True IDE Mode)			This signal is the same for all modes.
-INPACK (PC Card Memory Mode)	O	43	This signal is not used in this mode.
-INPACK (PC Card I/O Mode) Input Acknowledge			The Input Acknowledge signal is asserted by the CompactFlash™ Storage Card or CF+ Card when the card is selected and responding to an I/O read cycle at the address that is on the address bus. This signal is used by the host to control the enable of any input data buffers between CompactFlash™ Storage Card or CF+ Card and the CPU.

-DMARQ (True IDE Mode)			This signal is a DMA Request that is used for DMA data transfer between host and device. It shall be asserted by the device when it is ready to transfer data to or from the host. For Multiword DMA transfers, the direction of data transfer is controlled by –IORD and –IOWR. This signal is used in a handshake manner with –DMACK, ie., the device shall wait until the host asserts –DMACK before negating DMARQ, and re-asserting DMARQ if there is more data to transfer. DMARQ shall not be driven when the device is not selected. While a DMA operation is in progress, -CS0 and –CS1 shall be held negated and the width of the transfer shall be 16 bits. If there is no hardware support for DMA mode in the host, this output signal is not used and should not be connected at the host. In this case, the BIOS must report that DMA mode is not supported by the host so that device drivers will not attempt DMA mode. A host that does not support DMA mode and implements both PCMCIA and True-IDE modes of operation need not alter the PCMCIA mode connections while in True-IDE mode as long as this does not prevent proper operation in any mode.
BVD1 (PC Card Memory Mode)	I/O	46	This signal is asserted high as the BVD1 signal since a battery is not used with this product.
-STSCHG (PC Card I/O Mode) Status Changed			This signal is asserted low to alert the host to changes in the RDY/-BSY and Write Protect states, while the I/O interface is configured. Its use is controlled by the Card Config and Status Register.
-PDIAG (True IDE Mode)			In the True IDE Mode, this input / output is the Pass Diagnostic signal in the Master / Slave handshake protocol.
-WAIT (PC Card Memory Mode)	O	42	The –WAIT signal is driven low by the CompactFlash™ Storage Card or CF+ Card to signal the host to delay completion of a memory or I/O cycle that is in progress.
-WAIT (PC Card I/O Mode)			This signal is the same as the PC Card Memory Mode signal.
IORDY (True IDE Mode – Except Ultra DMA Mode)			In True IDE Mode, except in Ultra DMA modes, this output signal may be used as IORDY.
-DDMARDY (True IDE Mode – Ultra DMA Write Mode)			In True IDE Mode, when Ultra DMA mode DMA Write is active, this signal is asserted by the host to indicate that the device is ready to receive Ultra DMA data-in bursts. The device may negate –DDMARDY to pause an Ultra DMA transfer.

-DSTROBE (True IDE Mode – Ultra DMA Read Mode)			In True IDE Mode, when Ultra DMA mode DMA Write is active, this signal is the data out strobe generated by the device. Both the rising and falling edge of DSTROBE cause data to be latched by the host. The device may stop generating DSTROBE edges to pause an Ultra DMA data-out burst.
GND (PC Card Memory Mode)	--	1, 50	Ground.
GND (PC Card I/O Mode)			This signal is the same for all modes.
GND (True IDE Mode)			This signal is the same for all modes.
VCC (PC Card Memory Mode)	--	13, 38	+5V, +3.3V power
VCC (PC Card I/O Mode)			This signal is the same for all modes.
VCC (True IDE Mode)			This signal is the same for all modes.
RESET (PC Card Memory Mode)	I	41	When the pin is high, this signal Resets the CompactFlash™ Storage Card. The CompactFlash™ Storage Card is Reset only at power up if this pin is left high or open from power up. The CompactFlash™ Storage Card is also Reset when the Soft Reset bit in the Card Configuration Option Register is set.
RESET (PC Card I/O Mode)			The signal is the same as the PC Card Memory Mode signal.
RESET (True IDE Mode)			In the True IDE Mode this input pin is the active low hardware reset from the host.

6. Power Management

CompactFlash provides automatic power saving modes, and the following are the descriptions which address the conditions and reactions when a card enters a specific mode:

Standby Mode: When CF Card finishes the initialization routine after power reset, it goes into Standby Mode and will wait for Command In or Soft Reset.

Active Mode: If CF Card receives any Command In or Soft Reset, it goes into Active Mode. In Active Mode, CF card is capable of executing any ATA commands. Therefore, power consumption is the greatest under this mode.

Idle Mode: After CF Card executes any ATA Commands or Soft Reset, it goes into Idle Mode. Power consumption is reduced from Active Mode.

Sleep Mode: CF Card will enter Sleep Mode if there is no Command In or Soft Reset from the host. Sleep Mode provides the lowest power consumption. During Sleep Mode, the main clock of the system is stopped. Hardware reset, software reset or any ATA command assertion will awake the controller from Sleep Mode.

Data Setup for Wait Release	tv(WT)	tQVWTH		0		0		0		na[1]
Wait Width Time[2]	tw(WT)	tWTLWTH		350(3000 for CF+)		350(3000 for CF+)		350(3000 for CF+)		na[1]

NOTES:

1. -WAIT is not supported in this mode.
2. The maximum load on –WAIT is 1 LSTTL with 50pF (40pF below 120nsec Cycle Time) total load. All times are in nanoseconds. Dout signifies data provided by the CompactFlash Storage Card or CF+ Card to the system. The –WAIT signal may be ignored if the –OE cycle to cycle time is greater than the Wait Width time. The Max Wait Width time can be determined from the Card Information Structure. The Wait Width time meets the PCMCIA specification of 12us but is intentionally less in this specification.

NOTES:

1. -IOIS16 and -INPACK are not supported in this mode.
2. -WAIT is not supported in this mode.
3. Maximum load on -WAIT, -INPACK and -IOIS16 is 1 LSTTL with 50 pF (40pF below 120nsec Cycle Time) total load. All times are in nanoseconds. Minimum time from -WAIT high to -IORD high is 0 nsec, but minimum -IORD width shall still be met. Dout signifies data provided by the CompactFlash Storage Card or CF+ Card to the system. Wait Width time meets PCMCIA PC Card specification of 12µs but is intentionally less in this spec.

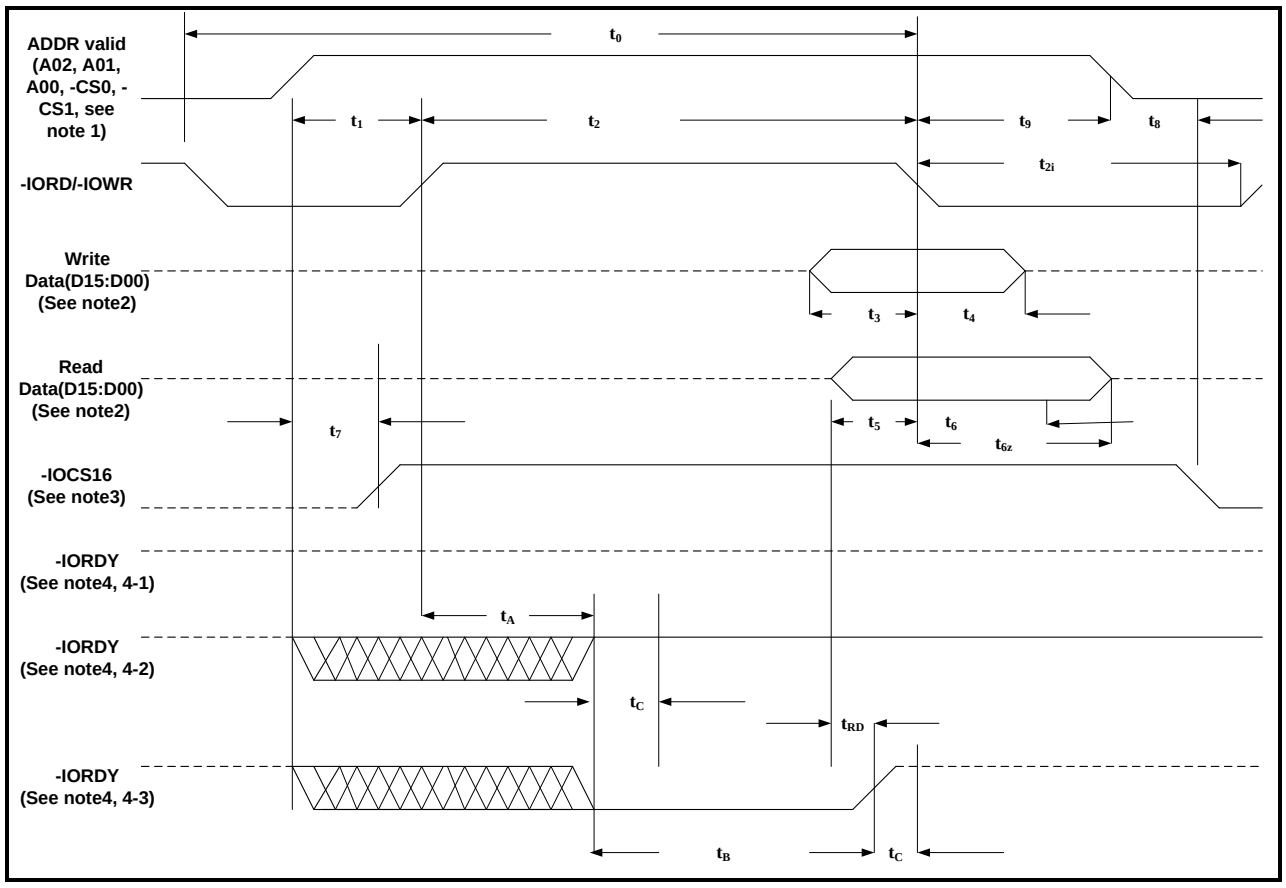
NOTES:

1. -IOIS16 and -INPACK are not supported in this mode.
2. -WAIT is not supported in this mode.
3. The maximum load on -WAIT, -INPACK, and -IOIS16 is 1 LSTTL with 50 pF (40pF below 120nsec Cycle Time) total load. All times are in nanoseconds. Minimum time from -WAIT high to -IOWR high is 0 nsec, but minimum -IOWR width shall still be met. Din signifies data provided by the system to the CompactFlash Storage Card or CF+ Card. The Wait Width time meets the PCMCIA PC Card specification of 12 µs but is intentionally less in this specification.

10.2. IDE Interface Timing (PIO Mode)



IDE Interface Timing (PIO Mode)

NOTES:

1. Device address consists of -CS0, -CS1, and A[02:00].
2. Data consists of D[15::00] (16-bit) or D[07::00] (8 bit).
3. -IOCS16 is shown for PIO modes 0, 1 and 2. For other modes, this signal is ignored.
4. The negation of IORDY by the device is used to extend the PIO cycle. The determination of whether the cycle is to be extended is made by the host after tA from the assertion of -IORD or -IOWR. The assertion and negation of IORDY is described in the following three cases:
   - ✧ Device never negates IORDY: No wait is generated.
   - ✧ Device starts to drive IORDY low before tA, but causes IORDY to be asserted before tA: No wait generated.
   - ✧ Device drives IORDY low before tA: wait generated. The cycle completes after IORDY is reasserted. For cycles where a wait is generated and -IORD is asserted, the device shall place read data on D15-D00 for tRD before causing IORDY to be asserted.

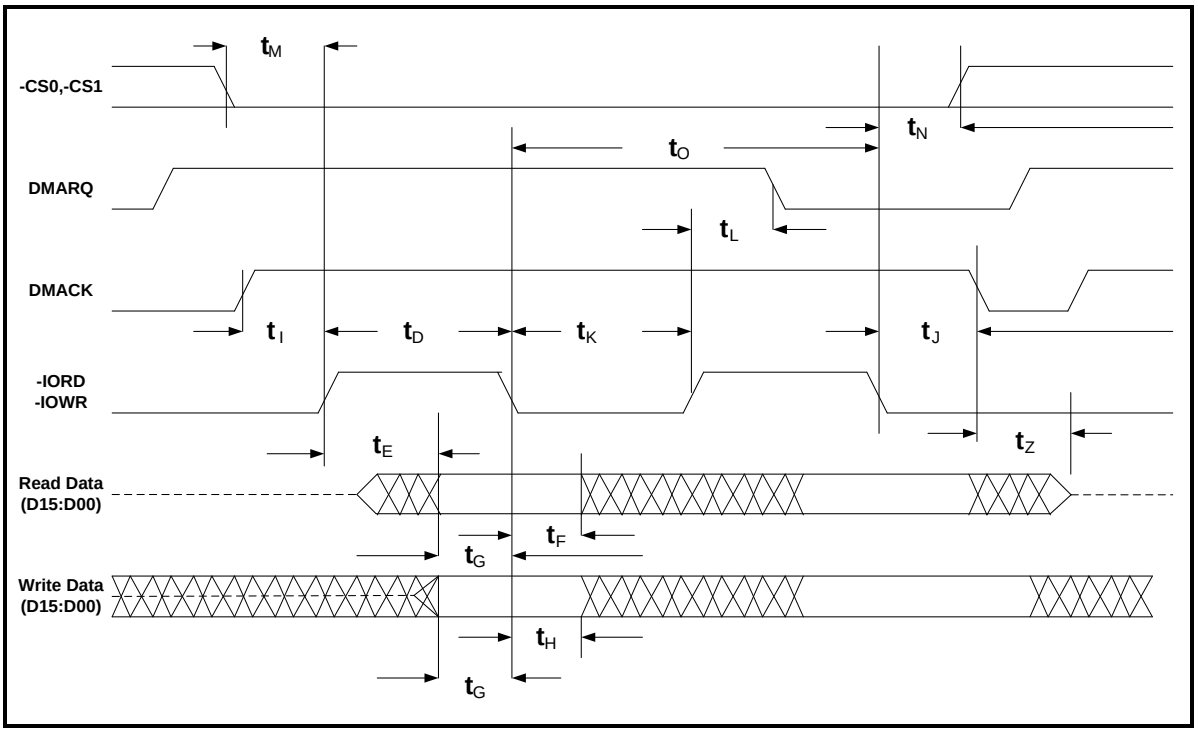
1. t0 is the minimum total cycle time, t2 is the minimum command active time, and t2i is the minimum command recovery time or command inactive time. The actual cycle time equals the sum of the actual command active time and the actual command inactive time. The three timing requirements of t0, t2, and t2i shall be met. The minimum total cycle time requirement is greater than the sum of t2 and t2i. This means a host implementation can lengthen either or both t2 or t2i to ensure that t0 is equal to or greater than the value reported in the device's identify device data. A CompactFlash Storage Card implementation shall support any legal host implementation.
2. This parameter specifies the time from the negation edge of -IORD to the time that the data bus is no longer driven by the CompactFlash Storage Card (tri-state).
3. The delay from the activation of -IORD or -IOWR until the state of IORDY is first sampled. If IORDY is inactive then the host shall wait until IORDY is active before the PIO cycle can be completed. If the CompactFlash Storage Card is not driving IORDY negated at tA after the activation of -IORD or -IOWR, then t5 shall be met and tRD is not applicable. If the CompactFlash Storage Card is driving IORDY negated at the time tA after the activation of -IORD or -IOWR, then tRD shall be met and t5 is not applicable.
4. t7 and t8 apply only to modes 0, 1 and 2. For other modes, this signal is not valid.
5. IORDY is not supported in this mode.

10.3. Multi Word DMA



Multi Word DMA

NOTES:

1. If the Card cannot sustain continuous, minimum cycle time DMA transfers, it may negate DMARQ within the time specified from the start of a DMA transfer cycle to suspend the DMA transfers in progress and reassert the signal at a later time to continue the DMA operation.
2. This signal may be negated by the host to suspend the DMA transfer in progress.

All waveforms in this diagram are shown with the asserted state high. Negative true signals appear inverted on the bus relative to the diagram.

MDMA Mode Timing Table

Item		Mode 0	Mode 1	Mode 2	Mode 3	Mode 4	Note
	Symbol	(ns)	(ns)	(ns)	(ns)	(ns)	
t_0	Cycle time (min)	480	150	120	100	80	1
t_D	-IORD / -IOWR asserted width (min)	215	80	70	65	55	1
t_E	-IORD data access (max)	150	60	50	50	45	
t_F	-IORD data hold (min)	5	5	5	5	5	
t_G	-IORD / -IOWR data setup (min)	100	30	20	15	10	
t_H	-IOWR data hold (min)	20	15	10	5	5	
t_I	DMACK to -IORD/-IOWR setup (min)	0	0	0	0	0	
t_J	-IORD / -IOWR to -DMACK hold (min)	20	5	5	5	5	
t_{KR}	-IORD negated width (min)	50	50	25	25	20	1
t_{KW}	-IOWR negated width (min)	215	50	25	25	20	1
t_{LR}	-IOWR to DMARQ delay (max)	120	40	35	35	35	
t_{LW}	-IOWR to DMARQ delay (max)	40	40	35	35	35	
t_M	CS(1:0) valid to -IORD/-IOWR	50	30	25	10	5	
t_N	CS(1:0) hold	15	10	10	10	10	
t_Z	-DMACK	20	25	25	25	25	

NOTE: t_0 is the minimum total cycle time and t_D is the minimum command active time, while t_{KR} and t_{KW} are the minimum command recovery time or command inactive time for input and output cycles respectively. The actual cycle time equals the sum of the actual command active time and the actual command inactive time. The three timing requirements of t_0, t_D, t_{KR} and t_{KW} shall be met. The minimum total cycle time requirement is greater than the sum of t_D, t_{KR} and t_{KW} for input and output cycles respectively. This means a host implementation can lengthen either or both of t_D and either of t_{KR} and t_{KW} as needed to ensure that t_D is equal to or greater than the value reported in the device's identify device data. A CompactFlash Storage Card implementation shall support any legal host implementation.

Ultra DMA Data Burst Timing Descriptions

Name	Comment	Notes
t2CYCTYP	Typical sustained average two cycle time	
tCYC	Cycle time allowing for asymmetry and clock variations (from STROBE edge to STROBE edge)	
t2CYC	Two cycle time allowing for clock variations (from rising edge to next rising edge or from falling edge to next falling edge of STROBE)	
tDS	Data setup time at recipient (from data valid until STROBE edge)	2, 5
tDH	Data ho ld time at recipient (from STROBE edge until data may become invalid)	2, 5
tDVS	Data valid setup time at sender (from data valid until STROBE edge)	3
tDVH	Data valid ho ld time at sender (from STROBE edge until data may become invalid)	3
tCS	CRC word setup time at device	2
tCH	CRC word hold time device	2
tCVS	CRC word valid setup time at host (from CRC valid until -DMACK negation)	3
tCVH	CRC word valid hold time at sender (from -DMACK negation until CRC may become invalid)	3
tZFS	Time from STROBE output released-to-driving until the first transition of critical timing.	
tDZFS	Time from data output released-to-driving until the first transition of critical timing.	
tFS	First STROBE time (for device to first negate DSTROBE from STOP during a data in burst)	
tLI	Limited interlock time	1
tMLI	Interlock time with minimum	1
tUI	Unlimited interlock time	1
tAZ	Maximum time allowed for output drivers to release (from asserted or negated)	
tZAH	Minimum delay time required for output	
tZAD	drivers to assert or negate (from released)	
tENV	Envelope time (from -DMACK to STOP and -HDMARDY during data in burst initiation and from DMACK	
	to STOP during data out burst initiation)	
tRFS	Ready-to-final-STROBE time (no STROBE edges shall be sent this long after negation of -DMARDY)	
tRP	Ready-to-pause time (that recipient shall wait to pause after negating -DMARDY)	
tIORDYZ	Maximum time before releasing IORDY	6
tZI ORDY	Minimum time before driving IORDY	4, 6
tACK	Setup and ho ld times for -DMACK (before assertion or negation)

tSS	Time from STROBE edge to negation of DMARQ or assertion of STOP (when sender terminates a burst)	

NOTES:

1. The parameters t_{UI}, t_{MLI}, and t_{LI} indicate sender-to-recipient or recipient-to-sender interlocks, i.e., one agent (either sender or recipient) is waiting for the other agent to respond with a signal before proceeding. t_{UI} is an unlimited interlock that has no maximum time value. t_{MLI} is a limited time-out that has a defined minimum. t_{LI} is a limited time-out that has a defined maximum.
2. 80-conductor cabling shall be required in order to meet setup (t_{DS}, t_{CS}) and hold (t_{DH}, t_{CH}) times in modes greater than 2.
3. Timing for t_{DVS}, t_{DVH}, t_{CVS} and t_{CVH} shall be met for lumped capacitive loads of 15 and 40 pF at the connector where the Data and STROBE signals have the same capacitive load value. Due to reflections on the cable, these timing measurements are not valid in a normally functioning system.
4. For all timing modes the parameter t_{ZIORDY} may be greater than t_{ENV} due to the fact that the host has a pull-up on IORDY- giving it a known state when released.
5. The parameters t_{DS} and t_{DH} for mode 5 are defined for a recipient at the end of the cable only in a configuration with a single device located at the end of the cable. This could result in the minimum values for t_{DS} and t_{DH} for mode 5 at the middle connector being 3.0 and 3.9 ns respectively.
6. This parameter applies to True IDE mode operation only.

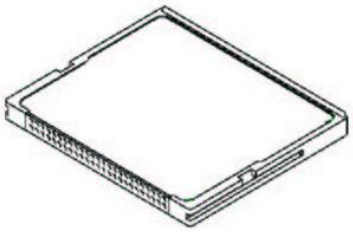
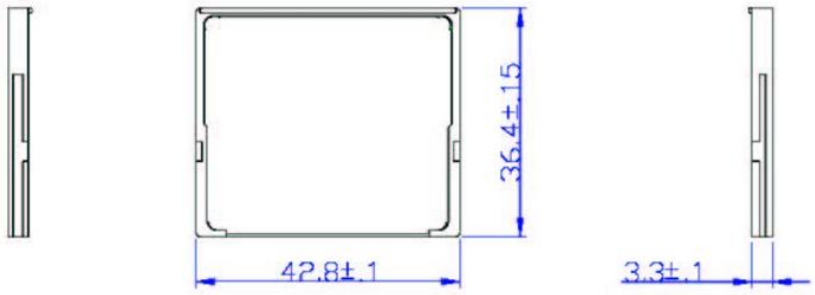
11. Package Specifications





12. LBA and CHS Parameters

LBA and CHS Parameters per Capacity

Capacity	LBA	CHS		
		Cylinders	Head	Sector
1GB	1883952	1869	16	63
2GB	3767904	3738	16	63
4GB	7535808	7476	16	63
8GB	15072624	14953	16	63
16GB	30146256	16383	16	63
32GB	61078752	16383	16	63
64GB	122158512	16383	16	63

Notes:

1. Date is tested by Toshiba 24nm SLC/19nm MLC Flash.
2. Value may vary from flash configuration.

Warning

• Do not bend, crush, drop, or place heavy objects on top of the Product. Do not use tweezers, pliers, or similar items that could damage the Product. Take particular care when inserting or removing the Product. Stop using the Product when the Product does not work properly. Failure to follow these instructions could result in fire, damage to the Product and/or other property, and/or personal injury including burns and electric shock.
• Keep out of reach of small children. Accidental swallowing may cause suffocation or injury. Contact a doctor immediately if you suspect a child has swallowed the Product. .
• Do not directly touch the interface pins, put them in contact with metal, strike them with hard objects, or cause them to short. Do not expose to static electricity.
• Do not disassemble or modify the Product. This may cause electric shock, damage to the Product, or fire.

Notes on usage

• The Product contains nonvolatile semiconductor memory. Do not use the Product in accordance with a method of usage other than that written in the manual. This may cause the destruction or loss of data.
• To protect against accidental data loss, you should back up your data frequently on more than one type of storage media. **** Corporation assumes no liability for destruction or loss of data recorded on the Card for any reason.
• When used over a long period of time or repeatedly, the reading, writing and deleting capabilities of the Product will eventually fail, and the performance speed of the Product may decrease below the original speed specific to the Product's applicable class.
• If the Product is to be transferred or destroyed, note that the data it contained may still be recoverable unless it is permanently deleted by third-party deletion software or similar means beforehand.

Product applications and design.

Product is intended for use in general electronics applications (e.g., computers, personal equipment, office equipment, measuring equipment, industrial robots and home electronics appliances) or for specific applications as expressly stated in this document. Product is neither intended nor warranted for use in equipment or systems that require extraordinarily high levels of quality and/or reliability and/or a malfunction or failure of which may cause loss of human life, bodily injury, serious property damage or serious public impact (“Unintended Use”). Unintended Use includes, without limitation, equipment used in nuclear facilities, equipment used in the aerospace industry, medical equipment, equipment used for automobiles, trains, ships and other transportation, traffic signaling equipment, equipment used to control combustions or explosions, safety devices, elevators and escalators, devices related to electric power, and equipment used in finance-related fields. Do not use Product for Unintended Use unless specifically permitted in this document.

No parts of this document may be reproduced , stored in a retrieval system, or transmitted, in any form or by any means, mechanical ,electric, photocopying, recording or otherwise, without permission of Wilk Elektronik S.A.
Wilk Elektronik S.A does not make any warranty ,express or implied, with respect to this document, including as to licensing, Non-infringement , merchantability or fitness for a particular purpose.
