电源滤波器的原理及其作用

The Principle and Function of Power Line Filter

电源滤波器，又名“EMI滤波器”，是一种无源双向网络（一端是电源，另一端是负载），可以对电源中特定频率的频点或该频点以外的频率进行有效滤除的电气设备。电源滤波器的原理是一种阻抗失配网络：电源滤波器输入、输出侧与电源和负载侧的阻抗失配越大，对电磁干扰的衰减就越有效。

电源滤波器的作用是使设备能够满足电磁兼容标准中对设备传导发射的要求，如：GB4343.1《家用电器、电动工具和类似器具的电磁兼容要求 第1部分：发射》、GB4824《工业科学和医疗（ISM）射频设备的骚扰特性限值和测量方法》、GB9254《信息技术设备的无线电骚扰限值和测量方法》。

电源滤波器是一种低通滤波器，它允许直流或50Hz的工作电流通过，而不允许频率较高的电磁干扰电流通过。电源滤波器是双向的，它既能防止电网上的干扰进入设备，滤除电网干扰对设备产生不良的影响，使设备满足敏感度的要求；又能防止设备自身产生的电磁干扰传到电网，满足传导发射的要求。

能够产生较强干扰的设备和对外界干扰高度敏感的设备都需要用到滤波器，比如产生强干扰的设备有：含有脉冲电路(微处理器)的设备、使用开关电源的设备、使用可控硅的设备、变频调速设备、含有马达（电机）的设备等；对外界干扰高度敏感的设备有：使用微处理器的设备、小信号模拟电路等。

Power line filter, also named EMI filter, which is a passive two-way networks (one end is the power supply and another end is load), is an electrical equipment that can effectively filter out the frequencies at specific frequency in the power supply or frequencies outside the frequency. The principle of the power line filter is an impedance mismatch network: the greater the impedance mismatch between the input and output sides of the power line filter and the power supply and load side, the more effective the attenuation of electromagnetic interference is.

The function of EMI filter is to enable the device to meet the requirements for conducted emissions from equipment in the EMC standard, such as, GB4343. 1"Electromagnetic Compatibility- Requirements for Household Appliances, Electric Tools and Similar Apparatus-Part 1: Emission", GB4824"Industrial, Scientific and Medical(ISM) Radio-frequency Equipment-Disturbance Characteristics-limits and Methods of Measurement", GB9254"Information Technology Equipment-radio Disturbance Characteristics-limits and Methods of Measurement".

EMI filter is a low pass filter, that allows DC or 50Hz operating current to pass without allowing higher frequency EMI currents to pass. The EMI filter is bidirectional. It can prevent the interference on the power grid from entering the equipment, filter out the adverse effects of the power grid interference on the equipment, and make the equipment meet the sensitivity requirements. It can also prevent the electromagnetic interference generated by the equipment itself from being transmitted to the power grid and meet the requirements of conducted emissions.

Filters can be used for devices that generate strong interference and devices that are highly sensitive to external disturbances. For example, devices that generate strong interference includes: devices with pulse circuits (microprocessors), devices that use switching power supply and the silicon controlled equipment, frequency conversion speed control equipment, equipment containing motors, etc.; equipment sensitive to external interference includes: equipment using microprocessors, small signal analog circuits, etc.
